Code Snippets

So this is a real game changer. With [Code Snippets plugin](#) it becomes real easy to tweak WordPress into doing exactly what you want. Normally I would look for a plugin if I wanted to change or add something. But now a lot of the little things can be done with Code Snippets.

Solution in the form of adding code to functions.php made me look further but now I just copy and paste is, give it a name, hit save and activate, switch tabs, renew and 9 times out of 10 it just works.

On this development site I'm collecting them all.
